

Mapping the Green Transition: Construction of an R-I-T Dataset

A Step-by-Step Methodological Audit Trail of the Regulator-Intermediary-Target Framework in EU Law.

Executive Summary & Core Objective

The Input (Raw Law)

Construct a compact, source-bounded dataset from 3 EU green-transition regulations using official EUR-Lex texts.

The Challenge (Methodology)

Capturing complex, relational roles without hard-coding permanent organisational identities.

The Output (Structured Data)

A researcher-adjudicated dataset structured across four linked levels, yielding 20 final regulatory episodes (12 intermediated, 8 direct).

Core Concepts Operationalized: The R-I-T Architecture

Crucial Insight:
R, I, and T are case- and context-specific roles, noles, not permanent attributes of organisations.

Dataset Scope & Case Selection

	European Climate Law (32021R1119)	CBAM (32023R0956)	EUDR (32023R1115)
Domain	Climate governance	Climate, trade, industrial decarbonisation	Deforestation, supply-chain governance
Total Final Relations	5	9	6
Intermediated vs. Direct	3 vs 2	5 vs 4	4 vs 2

Key Takeaway: Selection was prospective for **institutional diversity**, not based on known R-I-T results or expected **intermediary** counts.

The 10-Step Construction Engine

The following slides unpack how conceptual doubts were operationalized into definitive coding rules at critical pipeline junctions.

Phase 1: Foundation & The Contextual Doubt

Addresses Steps 1 & 2: Source acquisition and text separation.

Phase 2: Reconstructing Relationships

Addresses Steps 3 & 4: Source-bounded reading and architectural ordering.

Methodological Adjudication	
The Methodological Doubt	How do we prevent actor-label bias or confuse targets with objects?
Operationalized Rule	Establish a defensible Regulator-Target architecture first. Only materially involved third actors are then assessed as potential Intermediaries.

Phase 2: The Intermediary Test

Addresses Step 5: Functional testing for third actors.

Methodological Adjudication

The Methodological Doubt

How do we distinguish a true intermediary from an instrument (like a database) or a co-regulator?

Operationalized Rule (Actor vs. Object)

A candidate must perform a distinct, institutionally integrated regulatory function. Reports, databases, methodologies, and plans are treated as objects, not actors, unless the legally relevant actor behind them is explicitly identifiable.

Phase 3: Orientation & Calibration

Addresses Steps 6 & 7: Intermediation orientation and boundary adjudication.

Methodological Adjudication

The Methodological Doubt

Does an intermediary have to act directly upon the target? How do we handle external influence?

Operationalized Rule

Direct I→T action is not required. Regulator-facing expertise counts if legally integrated into the mechanism through which R regulates T. Mere opinion, lobbying, or generic external influence was strictly excluded.

Phase 4: Data Transformation

Addresses Steps 8 & 9: Normalizing labels and harmonizing mechanisms.

Core Operational Concept: Decomposing episodes ensures a single actor can inhabit different roles across different episodes. Identities are fluid; the data captures the relationship, not the organization's reputation.

Taxonomy of Intermediary Mechanisms

Reporting (3 instances)

Formal reporting or evidence transmission within the regulatory mechanism.

Certification (2 instances)

Validation of actors or compliance status (e.g., licensing/accreditation).

Auditing (1 instance)

Independent verification/assurance of regulated information or performance.

Other (7 instances)

Institutionally integrated functions outside focal families (comitology, expert consultation, scientific advice, border-info).

Note: Ranking/Rating yielded 0 instances. The 'Other' category deliberately preserves fine-grained EU functions rather than forcing them into ill-fitting focal families.

Step 10: Quality Assurance & Final Dataset Architecture

Addresses final structural validation and data dictionary finalization.

Descriptive Results: The R-I-T Landscape

Key Findings:

- 20 final regulatory episodes retained.
- 31 total Actor-Role records mapped.
- Among the 12 Intermediary records: 7 are regulator-facing, 4 bidirectional, 1 target-facing.
- Data Nuance: The 12 'I' records correspond to 11 distinct normalized labels (Customs authorities appear in both CBAM and EUDR).

Architectural Examples in Practice

Climate Law: EEA & Scientific Advisory Board

Mechanism: Regulator-facing reporting/assessment. Advisory inputs are structurally integrated into Commission evaluations.

CBAM: Accredited Verifiers & National Accreditation Bodies

Mechanism: Auditing & Certification. Verifiers check embedded emissions; bodies accredit verifiers; Customs links to compliance systems.

EUDR: Customs Authorities

Mechanism: Border-information transmission. Connecting product release with due diligence information; substantiated concerns create formal reporting channels.

Interpretation & Scope

Interpretation Warning

This is a theory-calibrated, source-bounded pilot. Counts should NOT be interpreted as population estimates of intermediation across all EU legislation.

Pilot System

Strategic Value

A highly transparent, deeply validated dataset designed for refining R-I-T coding architectures and testing taxonomy portability for future large-N collection.

Final Status & Reference

Final cleaned dataset, prepared for external sharing.
No provisional coding included.
