

Mapping the EU Regulatory Corpus

A source universe for a delimited, extractable and comparable dataset

discussion deck - not a fixed design

Core idea

Start from an externally defined EU policy universe, then extract canonical legal texts and only afterwards reconstruct regulatory relationships.

This deck deliberately keeps alternative corpus strategies open for David to redirect the design.

The immediate methodological problem: population first

A corpus selected because it already contains intermediary-like words would bias the study before it starts.

selection on the dependent variable

cleaner basis for R-I-T coding

Working principle

The population should be defined by the regulatory domain, not by the vocabulary of intermediation.

EUR-Lex is the canonical legal-text layer

For a legal corpus, EUR-Lex gives us stable identifiers, official texts and documentary provenance.

What it is good for

- canonical legal documents
- reproducible CELEX-based retrieval
- direct citation to provisions

What it does not solve alone

- population definition
- implementation practice
- technical guidance beyond the act

Implication
Use EUR-Lex as the legal anchor, not necessarily as the only empirical universe.

The EU regulatory scene is a multi-level governance field

Actors are not permanently R, I or T. Their role depends on the relation, function and mechanism observed.

Analytical translation

**Institutional map first.
R-I-T relation second.**

The source universe is layered - not flat

The main risk is to mix documents with different legal status, functions and evidentiary value.

Green Deal / Fit for 55 can define a defensible population

This is the strongest route I found for a delimited and extractable climate-transition corpus.

Why this helps

- externally defined universe
- sectoral diversity within climate policy
- low-cost CELEX extraction

What David may change

- narrow to a sub-domain
- include/exclude secondary acts
- choose period and document types

My view

A good starting population, but not the only possible one.

Alternative and complementary repositories

Each repository answers a different research question. The corpus design should decide which question we privilege.

Formation	OEIL + Have Your Say	How the regulatory design is negotiated before adoption
Canonical law	EUR-Lex + Cellar	What the binding legal architecture says
Implementation	Comitology + delegated/implementing acts	How rules are operationalized after adoption
Technical layer	EU agencies + standards/guidance	How expertise, verification and compliance routines are specified
Translation	N-Lex	How EU obligations travel into national law
Contest/settlement	CURIA	How authority, delegation and enforcement are disputed
Design choice	Treat these as modules that can be added sequentially, not as one undifferentiated document soup.	

An extractable dataset needs a minimal data architecture

The corpus should be designed so every relation can travel back to a source, a provision and a textual trace.

Minimum fields

Central rule: lexical screening can find candidates; only substantive reconstruction can classify regulatory relations.

Three corpus scenarios for David to redirect

I am not proposing a final corpus here. I am exposing the feasible design space.

Minimal legal corpus

EUR-Lex acts only

best for clean legal coding; weaker on implementation practice

Policy-population corpus

Green Deal / Fit for 55 + CELEX

best balance between delimitation, relevance and extraction

Multi-layer governance corpus

EUR-Lex + Cellar + Comitology + Agencies

richest for intermediation; highest risk of scope creep

Recommendation for discussion

Start with scenario B, then decide whether secondary implementation layers should be added as a second-stage corpus rather than mixed from the beginning.

Open questions for David

The deck is meant to support a methodological conversation, not to close it.

- 1 Domain** climate transition broadly, Fit for 55, or a narrower family such as carbon markets?
- 2 Population** Commission-curated list, all CELEX within a period, or another external frame?
- 3 Document types** binding acts only, or include delegated/implementing acts and guidance?
- 4 Unit of analysis** legal act, provision, actor-role episode, or R-I-T relation?
- 5 AI role** screening assistant, coding assistant, or benchmark-comparison instrument?

Proposed meeting line

"I mapped the universe of official and semi-official EU sources to identify corpus options. My suggested path is Fit for 55 as the population frame and EUR-Lex/Cellar as the extractable legal corpus, but I would like your view on whether a different population or source layer better fits the theoretical question."

Source notes

- EUR-Lex - official access to EU law and the Official Journal; CELEX identifiers for stable legal citation.
- European Commission - types of EU law; ordinary legislative procedure; delegated and implementing acts.
- European Commission - Legal documents on Delivering the European Green Deal; Fit for 55 delivery pages.
- Council of the EU - Fit for 55 policy page and legislative package overview.
- Publications Office of the EU - Cellar as dissemination repository and linked-data infrastructure.
- Comitology Register - committees, agendas, draft implementing acts, votes and related documents.
- European Parliament Legislative Observatory (OEIL); Have Your Say / Better Regulation; N-Lex; CURIA.

Internal methodological anchor: project memo on R-I-T architecture, EUR-Lex/CELEX provenance, lexical screening versus substantive reconstruction, and the need to establish the population independently from intermediary hits.
